

PREDICTED IGCSE OUTCOMES

Victoria Park Academy Shenzhen — CIE IGCSE Computer Science (0478)

5-Mock Exam Series & Grade Trajectory Projection

深圳维多利亚公园学院 — IGCSE 计算机科学成绩预测

METHODOLOGY OVERVIEW | 方法论概述

The 5-mock examination system is designed to identify learning gaps early and enable targeted intervention. The structure is as follows:

- Mock 1 (Y10S1, Week 12) — Baseline diagnostic | 基线诊断
- Mock 2 (Y10S2, Week 4) — Checkpoint 1 | 检查点 1
- Mock 3 (Y10S2, Week 8) — Checkpoint 2 | 检查点 2
- Mock 4 (Y10S2, Week 10) — Final rehearsal | 最终彩排
- Mock 5 (Y10S2, Week 11) — Confidence builder | 信心建立

Key interventions between mocks:

- Bilingual gap-analysis reports (English/Chinese) | 双语差距分析报告
- Targeted revision clinics for identified weaknesses | 针对性复习诊所
- Scaffolded re-teaching of abstract concepts | 抽象概念的支架式再教学
- EAL-specific vocabulary reinforcement | EAL 特定词汇强化

This system ensures no student enters the final examination with undiagnosed weaknesses in Paper 1 (Theory) or Paper 2 (Problem Solving & Programming).

3-YEAR OUTCOME TRAJECTORY | 三年成绩轨迹

The projections below are based on the mock-exam system and assume consistent cohort ability, full programme implementation, and stable staffing.

Year 1 — FOUNDATION YEAR | 基础年 (First Cohort / 首批学生)

Building systems, establishing routines, refining bilingual resources.

Focus: embedding the 5-mock cycle, calibrating difficulty to CIE standards.

Projected Grade Distribution (% of cohort) | 预计成绩分布 (占学生群体百分比) :

Year 2 — EMBEDDED YEAR | 巩固年

Systems mature, staff experienced, resources refined from Year 1 data.

Focus: tightening gap between Mock 4 and final examination performance.

Projected Grade Distribution (% of cohort) | 预计成绩分布 :

A*	A	B	C	D	E	U	
顶尖	优秀	良好	中等	及格	边缘	未通过	
10-15%	30-35%	25-30%	12-15%	3-5%	1-3%	0-2%	
A*-A Range: 40-50%				A*-C Pass Rate: 80-90%			

Year 3 — MATURE PROGRAMME | 成熟项目 (HIGHER END PROJECTION)

Full programme established, bilingual scaffolding fully optimised,

historical data informs precise targeting. All staff fully trained.

Focus: sustaining excellence, pushing borderline students to next grade.

Projected Grade Distribution (% of cohort) | 预计成绩分布：

A*	A	B	C	D	E	U	
顶尖	优秀	良好	中等	及格	边缘	未通过	
15-20%	30-35%	20-25%	10-15%	2-4%	0-2%	0-1%	
A*-A Range: 45-55%				A*-C Pass Rate: 85-92%			

MOCK PROGRESSION MAPPING | 模拟考试进度映射

The table below shows the expected relationship between mock performance in

Year 2 and final IGCSE grade attainment.

下表显示了第二年模拟考试表现与最终 IGCSE 成绩之间的关系。

Mock Average	Predicted Final Grade (CIE IGCSE 0478)
模拟考试平均分	预测最终成绩
85%+	A* (顶尖)
75-84%	A (优秀)
65-74%	B (良好)
55-64%	C (中等)
45-54%	D (及格)
35-44%	E (边缘)
Below 35%	U (未通过) — intensive intervention required

The 5-mock structure provides five data points per student. Students scoring consistently within a band across Mocks 3-5 are highly likely to achieve the corresponding final grade, barring exceptional circumstances.

WHY THESE PROJECTIONS ARE ACHIEVABLE | 为何这些预测是可以实现的

1. EARLY DIAGNOSIS (Mock 1 at Y10S1) | 早期诊断

Weaknesses identified 6 months before examination, allowing sustained intervention rather than last-minute cramming.

2. BILINGUAL SCAFFOLDING | 双语支架

Chinese EAL learners receive concept explanations in their first language for abstract Computer Science topics, reducing cognitive load and enabling deeper understanding of English examination questions.

3. TARGETED REVISION CYCLES | 针对性复习周期

Each mock generates individualised gap-analysis. Re-teaching focuses only on demonstrated weaknesses, maximising efficiency in the 72-week programme.

4. EXAM TECHNIQUE MASTERY | 考试技巧掌握

Mocks 4 and 5 use CIE-style papers under examination conditions. Students enter the final exam with five prior experiences, minimising anxiety and maximising time management.

5. CULTURALLY ANCHORED LEARNING | 文化锚定学习

Concepts taught through familiar Chinese digital contexts (WeChat, Alipay, Bilibili) improve retention and enable students to construct more sophisticated responses in examination settings.

CAVEATS | 注意事项

These projections assume:

- Full implementation of the 4-semester, 72-week programme
- Stable staffing and continuity of the 5-mock system
- Cohort ability in line with VPA Shenzhen's typical intake
- Student attendance and engagement at expected levels

External factors (CIE grade boundary shifts, global cohort performance) may affect outcomes. The 5-mock system includes built-in flexibility to adjust targeting in response to such variables.

这些预测假设：完整实施四个学期、72 周的课程；稳定的师资和 5 次模拟考试系统的连续性；学生能力与 VPA Shenzhen typical intake 相符；学生出勤和参与度达到预期水平。外部因素（CIE 等级边界变化、全球学生群体表现）可能会影响结果。
